($\Leftarrow$) $X^TX(\hat{\beta} + (I - X^-X)z)$

$= X^TX\hat{\beta} + (X^TX - \underbrace{X^TXX^-X}_{=X})z$

$= X^Ty$: solution.

($\Rightarrow$) Note that the solution of $X^TX\beta = X^Ty$ can be expressed by $\hat{\beta} = x_p + x_n$.

where x_p is a solution of $X^TX\beta = X^Ty$.

and x_n is a solution of $X^TX\beta = 0$

Here, $x_n \in N(X^TX)$

& $X^TX(I - X^-X) = X^TX - X^TX = 0$

So $X^TX(I - X^-X)z = 0 \Rightarrow (I - X^-X)z \in N(X^TX)$.

Also, a possible x_p is $\hat{\beta} = X^-y$ in (1)

So, $\hat{\beta} = x_p + x_n$
